

Eden/Carouse

Total Nitrogen	1%
Available Phosphate	1%
Soluble Potash	2%

Contents- Plant proteins, animal proteins, vitamins, minerals, amino acids, and trace minerals; specialized, preselected, adapted soil microbes, bio-organic catalysts and microbial growth stimulants.

Eden is a microbial inoculant. Many of our modern agricultural practices adversely affect the microbial life in the soil. **Eden** is a specific blend of dried microbes that can help reestablish the microbial population. The cold soils and short growing season in Alaska increase the importance of feeding the beneficial fungi and bacteria in our soils. **Eden** can be used on soil certified for organic crop production.

Eden adds organisms to the soil that feed beneficial bacteria and fungi. Several miles of fungi filament and millions of good bacteria can be present in less than a thimble full of healthy soil. These fungi and bacteria benefit the soil by improving nutrient and water uptake, root and plant growth. They help improve soil structure, build humus, disease resistance and reduce plant stress.

Application: 1/2 pound **Eden** per 1000 sq. feet .
10 lbs. per acre.

Eden/Carouse may be applied with the broadcast mix when preparing the soil for planting.

Store at temperatures below 100°F. Keep dry and out of direct sunlight. Freezing is not recommended.
