

JUBILATE

Jubilate is a broad-spectrum microbial inoculant, including mycorrhiza, in a base of four different **mineral rock powders**.

Jubilate provides a slow-release supply of **phosphorous, calcium, potassium, sulfates**, and a broad-spectrum of **trace minerals**. A **carbon powder** further assists the biology in digesting the rock powders.

Application rates are adjustable for soil conditions. **Jubilate** is beneficial to the soil food web.

For planting seeds: Dust the furrow before adding seeds. Dust seeds with **Jubilate** in the furrow.

For potting mix: Blend into mix at the rate of **1 part Jubilate** to **20** soil mix.

Transplants: Add **1 tsp.** to **1 Tbsp.** into each planting hole, depending on the root structure.

Jubilate increases root mass and provides the growing plants with trace minerals while inoculating the soil with biology to feed life in the soil.

Jubilate works synergistically with **OND**, an organic nutrient drench designed to gently feed the plants as they germinate and increase soil energy.

CAUTION: Jubilate is a powder and could cause respiratory or eye irritation. Avoid breathing contents or applying under windy conditions without adequate protection from goggles or a dust mask.

Jubilate is a product of International Ag Labs High Brix Garden Program
